THE QUESTION

How can universities and training providers use AI to support learning without weakening it?

THE SHORT ANSWER

AI can strengthen accounting education by explaining, offering practice and giving feedback, but only when it guides rather than gives, instructors set boundaries by assessment, explanations are grounded in approved sources, student data is protected and success is measured by what students can do unaided.

FOUR KEY IDEAS

1 Guide, do not give

Staged hints, explained reasoning and sources keep the thinking with the student. A tool that cannot be told not to give the answer is harder to use well.

2 Boundaries by assessment

No AI, study only, assisted with disclosure, or AI-integrated, with assessments designed to value process and judgment. Treat AI-text detectors with caution.

3 Ground it in sources

Explanations tied to approved course material and citations teach the habit of finding and checking authority.

4 Protect and measure

Minimize and explain student data, ensure equitable access, and judge success by unaided learning outcomes, not tool usage.

WHO SHOULD READ THE FULL PAPER

Accounting educators, programme and course leaders, academic-integrity and learning-technology teams, and institutional leaders responsible for AI policy.

INSIDE THE FULL PAPER

What the full paper covers

#	SECTION	WHAT IT ANSWERS
1	What AI can and cannot do for learning	The same capability can strengthen or weaken learning, depending on how it is used.
2	Guided practice and learning mode	A learning tool should behave differently from a work tool.
3	Academic integrity	Clear rules, designed assessments and honest limits on detection protect integrity better than surveillance does.
4	Source-governed learning	A tutor that cannot show its sources teaches the wrong habit.
5	Student data, privacy and equity	Students are not customers to be profiled. They are learners entitled to care.
6	Governance for institutions	A short, clear policy and named responsibilities do more than a long document nobody reads.
7	Piloting and measuring whether it helps	Start in one course, with clear boundaries, and measure learning rather than usage.

QUESTIONS THIS PAPER HELPS YOU ASK

☐	What should students be able to do without the tool?
☐	What is the permission level for each assessment, and have students been told?
☐	Can instructors set how much help is available?
☐	What student data is collected, kept and used, and by whom?
☐	How will we measure whether learning improved?
