THE QUESTION

Is AI safe for accounting?

THE SHORT ANSWER

Safety is not a property of a model. It is a property of the system around it: the sources it may rely on, the boundaries it will not cross, the people who stay accountable and the evidence it leaves behind. Governed accounting intelligence reverses the defaults of a general-purpose chat tool, and you can test for it.

FOUR KEY IDEAS

1 Ask “is it governed?”

Replace “is the model safe?” with a question that can be tested: is the system bound to approved sources, constrained by boundaries, escalated to people and recorded?

2 Four layers, all needed

Sources, Controls, People and Evidence. Remove any one and the system reverts to a fluent guess.

3 The evidence gate

Source authority and escalation come first. If a vendor cannot show both, nothing else on the scorecard matters.

4 Build the case from your numbers

Use the 12-criterion scorecard, a controlled pilot and written success criteria, then bring the evidence to the board.

WHO SHOULD READ THE FULL PAPER

CFOs, accounting firm partners, CTOs, AI governance owners, audit, tax and enterprise finance leaders deciding whether and how AI enters professional accounting work.

INSIDE THE FULL PAPER

What the full paper covers

#	SECTION	WHAT IT ANSWERS
1	The market question: is AI safe for accounting?	The question is understandable, and it is incomplete.
2	From prompts to governed intelligence: the thesis	Governed intelligence binds answers to sources, boundaries, escalation and a record.
3	Source authority	An accounting answer is only as trustworthy as the authority behind it.
4	Professional boundaries and escalation	A governed system knows where its remit ends, and what to do when it gets there.
5	Audit evidence and evaluation discipline	If you cannot reconstruct how an answer was produced, you cannot defend it.
6	The board and C-suite adoption thesis	A board needs to know what it is approving and who is accountable.
7	An evaluation scorecard you can use today	Twelve vendor-neutral criteria to score in your own evaluation, with the evidence behind each score.
8	An adoption roadmap	Five phases.
9	Where ZoikoLogia™ fits	We built ZoikoLogia™ with Kriton™ around these ideas, and you should hold us to the same scorecard.
10	Next step: test it on your own work	The real evidence is how a system behaves on your sources, with your reviewers.

QUESTIONS THIS PAPER HELPS YOU ASK

☐	Which approved, current, versioned sources does an answer rest on?
☐	What will the system decline, and how does it behave at the edge of its remit?
☐	When a matter is high-risk, who receives it and with what context?
☐	Can we reconstruct what was asked, relied on, answered and reviewed?
☐	Can we test it on our own work, against a baseline, with criteria agreed beforehand?
